Sports Data Soccer API - Possession Events Feed (MA13)

Get all possession data for each action in a game, including player, team, event, type, minute, second, and qualifiers.

Overview

The Soccer **Possession Events feed** is a time-coded feed that lists all contestant and player possession events within the game with a contestant (team/squad), player, event, type, minute and second for each event. Each has a series of qualifiers describing it. You can see complete lists of **Event types** and **Qualifier types**, and an **Appendix** to put this all into context all within this guide.

For more details refer: <https://www.theanalyst.com/eu/2021/03/possessions-and-sequences-in-football/>

Required Compliance:

To comply with our API security and best practice logic for your API calls please refer to our **FAQs**. We also recommend that you take a look at our **API Overview and Authentication Guide**. You will learn the basics of how our API works and key concepts to get started.

Note: This feed is available only to Tier 13 (and above) and Tier 10/12 upon re-analysis.

How Often Should I Poll The Feed?

We have provided some guidelines to help ensure that you call the feed only as often as you need to. Make sure that you don't exceed the rate confirmed with us - this can vary depending on whether you make requests as a B2B or B2C outlet - if you need more information on this, contact your Stats Perform representative.

UPDATED	POLLING FREQUENCY							
	TIER 15	TIER 12+14	TIER 4	TIER 13	TIER 8+9+10+11	TIER 6+7	TIER 5	TIER 1+2+3
Updated on key events	See Tier 13	Post-match	N/A	- For every goal - End of the match	N/A			

Possession Events (MA13) Guide

USAGE	FEED
GET possession events data for a match by fixture UUID. <i>Required:</i> Fixture UUID. See the query parameters table below.	/soccerdata/possessionevent/{outletAuthKey}{queryPara

If your request URL is as follows (does not contain a fixture UUID), the feed returns an error:
/soccerdata/possessionevent/{outletAuthKey}

Query Parameters And Example Request Parameters

This feed also makes use of the **Global query parameters**, and you can combine them with the following query parameters (some of which can be used in conjunction with each other). However, you must query the **/possessionevent** feed by a specific fixture (match) UUID.

Legacy IDs: You can use the **fx** parameter to filter by legacy IDs - only one ID is supported (you cannot pass multiple IDs in a comma-separated list).

How to use query parameters and make successful requests:

In our guides, we use HTTPS syntax for our example **GET** requests (rather than cURL, for example). All URLs are case-sensitive - this means that URL strings must contain the correct case and operators. You **MUST** format your requests correctly and include certain information; otherwise, an error will be returned. You can find information about the API, including the base URL (`{protocol}://{requestDomain}/{feedResource}`), in the **main guide** and **API Overview and Authorisation guide**.

- Include the following information in the URL or header and make sure it is correct for your outlet: your unique and valid **{outletAuthKey}** this must be after the Outlet Authentication Key (and endpoint, if applicable). for **_rt={mode}** (operating mode) and **_fmt={dataFormat}** (response format), entity query parameter and UUID.
- Begin the query parameter string with **?** (question mark) - this must be after the Outlet Authentication Key (and endpoint, if applicable). To build up a query string, make sure that each query parameter is separated by the **&** (ampersand) operator. Values must be separated by the correct operator, for example **&** (multiple values, 'AND'), or - if a parameter supports it - **,** (multiple values, 'OR') or **!** ('NOT').
- Use the required **_** (underscore) for any parameters listed with this prefix.
- Remove any placeholder value curly braces **{ }** from your calls (we include these as an example only).
- If using the JSONP format (**_fmt=jsonp**) you **MUST** use it in combination with the callback parameter (**_clbk**) and a fixed value (or where you use a different value in a different instance, you must do this as little as possible). Be aware that common JavaScript frameworks, such as jQuery, can default to use randomly-generated function names - you must make sure that these are overridden and define a fixed function name instead.

Query parameter	Value and description
{fixtureUuid} Fixture UUID	GET possession events for a match by the specified fixture UUID (path parameter method) . Pass the fixture UUID in the request URL directly as the {assetId} (asset/resource ID).

Query parameter	Value and description
	GET https://api.performfeeds.com/soccerdata/possessionevent/{outletAuthKey}/{ fixtureUuid ?_rt={mode}&_fmt={dataFormat}}
fx	GET possession events for a match by the specified fixture UUID (query parameter method). Pass the fixture UUID to the fx parameter. GET https://api.performfeeds.com/soccerdata/possessionevent/{outletAuthKey}?_rt={mode}&_fmt={dataFormat}&fx={fixtureUuid}

Sample Calls

These sample calls let you see an example URL and the response - click on the links below (hyperlinks open in a new window).

 ▶<suspension>
 ▶<scores>
 ▶<ht>
 ▶<ft>
 ▶<et>
 ▶<pen>
 ▶<total>
 ▶<totalUnconfirmed>
 ▶<events>
 ▶<event>
 ▶<qualifier>

Event Types

Events are delivered as an array (under `events` for XML or `events` for JSON). When an event occurs during a match, it is assigned a unique Event ID. For each unique Event ID, there is an associated Event Type ID (`typeId`) which classifies the general event type that has occurred. It is common for an event instance to be accompanied by a Qualifier array (under `qualifier`). Each Qualifier has an ID and a Qualifier ID (`qualifierId`) and value - these explain and add depth and further information about the event. However, it is not mandatory (some events will not have qualifiers).

Use this table to look-up an Event Type ID and its description. You should also cross-reference any related Qualifier ID values with the [Qualifier Types](#) list.

Event Definitions

We have a long-established, consistent list of 'Event Definitions' in football that are adhered to across all data collection centres. You can find the most up-to-date definitions in the [Opta Glossary](#), where we maintain an up-to-date list of the main football events logged by Opta.

▶SHOW/HIDE: event typeId | name | description

Qualifier Types

Qualifiers are linked to Event Types and provide more detailed information about the specific event that occurred. Each event can have a series of qualifiers describing it.

The Event Type ID classifies the general event type (such as a Pass event: `"typeId": 1`).

The Qualifier array provides further details (such as pitch coordinates or the type of Pass event) - it contains the following:

- `qualifierId` - this represents the specific event. For example, the type of Pass event, such as a 'Through Ball' (`"qualifierId": 4`).
- `value` - contains any related information. For example, pitch coordinates for the pass start point and pass end point.

Use this table to look-up a Qualifier ID and its description. You should also cross-reference any related Event Type ID values with the [Event types list](#), and check the [Appendix](#) to get more information about the following: [Pitch coordinates and direction of play](#) | [Goalmouth coordinates](#) | [Pitch zones](#) | [Playing positions](#) | [Formations explained](#) | [Kit IDs](#)

►[SHOW/HIDE: qualifierId | name | description | associated event typeId values](#)

Appendix

This section helps give further context to some Events and their Qualifiers, such as pitch coordinates and other data. Click on the buttons below to view each section.
