

goal.live × Stats Perform — Feed & API Integration Plan

Developer licence application · Soccer — Spanish La Liga, season 2026/27 · DotLive Interactive — Peter Krulis, Founder — petrkrulis@gmail.com · July 2026
Companion to our earlier *goal.live × Stats Perform Integration Brief* (June 2026).

1. PRODUCT & CURRENT INTEGRATION STATUS

goal.live is a patent-pending interactive betting overlay rendered on top of live football streams: users bet on in-game micro-moments (next goal, next corner, next scorer) without leaving the stream, with instant on-chain USDC settlement. Our platform already runs a **working Opta SDAPI integration** on trial keys:

Component	Feed / product	Endpoint (as integrated)	Status
OAuth 2.0 client-credentials auth	SDAPI Gateway	api.statsperform.com	✓ Live
Match status, score, minute sync (60 s cron)	MA1 Fixtures & Results	/soccerdata/match/{outletAuthKey}?live=yes&_dlt=...	✓ Live
Goal / corner event detection (typeId 16/22, own-goal q.55)	MA3 Match Events	/soccerdata/matchevent/{outletAuthKey}/{fixtureUuid}	✓ Live
Starting XI auto-seeding into player markets	MA46 Provisional Line-Ups	/soccerdata/matchprovisionallineup/...	✓ Live
Bet locking, odds history, on-chain settlement pipeline	Internal (driven by MA1/MA3)	Supabase edge functions + smart-contract oracle	✓ Live

This document sets out every additional feed, API and delivery mechanism we intend to use under the La Liga developer licence, and how each maps to product functionality.

2. BETTING MARKETS — CURRENT AND PLANNED (FEED MAPPING)

We currently operate four markets: *match outcome (1X2)*, *total goals*, *next corner*, *next goal scorer*. Under this licence we will expand to the full set of high-demand in-play markets (the markets with the highest live-betting volume at major sportsbooks), each priced and settled from Opta feeds:

Market	Status	Priced from	Settled from
Match outcome (1X2), live	Live	MA21 Live Win Probability	MA1 / MA3DP
Total goals (O/U), exact goals	Live	MA21 goal-rate model + MA12 xG	MA3DP goal events
Next corner / corners race / corner totals	Live	MA47 Match Corners Preview + in-play state	MA3DP corner events (typeld 6/22)
Next goal scorer / anytime scorer	Live	TM15 Team & Player Forecast + MA46 line-ups	MA3DP goal events + scorer ID
Next team to score	Planned	MA21 + MA27 Momentum	MA3DP
Both teams to score (BTTS)	Planned	MA21 goal-rate model	MA3DP
Cards: next card, booking points, red card	Planned	MA3 card history + referee profile (PE3/PE13)	MA3DP card events (typeld 17)
Player props: shots / shots on target / fouls / player card	Planned	Dynamic Betting Stats API + MA3 per-player events	MA3DP qualified events
Penalty awarded in match	Planned	MA19 Match Penalties Preview	MA3DP penalty events
Half-time markets (HT result, goals per half)	Planned	MA21 + period state	MA1/MA3DP period boundaries

Why these markets: next goal, over/under totals, corners, bookings and player props are consistently the highest-volume in-play markets at leading sportsbooks — they are also precisely the micro-moment markets our overlay UX is designed for. Every market above is fully priceable and settleable from Opta data alone, keeping Stats Perform the single source of truth.

3. LIVE EVENTS — MIGRATION FROM POLLING TO PUSH (SDDP)

Today we poll MA1/MA3 every 60 seconds, which caps our market-suspension latency. Under the developer licence we will migrate the live pipeline to **Sports Data Delta Push (SDDP)** feeds:

Push feed	Replaces (poll)	Content / use in goal.live
MA1DP — Live Score	MA1 polling	Score, match status, period, minute — drives match lifecycle, bet-window open/close
MA3DP — Match Events Data	MA3 polling	Time-coded events (goals, corners, cards, penalties, VAR, substitutions) with player IDs and qualifiers — drives instant market suspension and on-chain settlement triggers
MA2DP — Match Stats Data	—	Live team stats (shots, possession, SOT) — overlay stat strip + player-prop settlement inputs
MA18DP — Match Events Aggregated Stats	—	Aggregated per-player event stats — player-prop markets (shots, fouls, cards per player)

Integration change on our side: we will add a persistent push-consumer service (long-lived connection per the SDDP integration guide) in front of our existing normalisation layer. Deltas are applied to match state in Supabase and fanned out to clients over our existing realtime channels — the downstream pipeline (odds engine, bet locking, smart-contract settlement) is unchanged. Target: **event-to-market-suspension < 1 s** from delta receipt (vs up to 60 s today). We request SDDP onboarding documentation and a sandbox/staging endpoint to validate connection management, recovery/replay and message ordering before the season starts.

4. PROBABILITIES AS ODDS — OPTA MODEL FEEDS AS OUR PRICING SOURCE

This is the most important element of this application. Traditional bookmaker odds feeds are third-party prices; Stats Perform's **model-generated probabilities** let us price markets directly from Opta's predictive models — a cleaner fit for our transparent, on-chain product:

Feed	Endpoint	What it gives us
MA21 Live Win Probability	/soccerdata/matchlivewinprobability/{outletAuthKey}/{fixtureUuid}	Pre-match + live home/draw/away probabilities from Opta's goal-rate model (100,000+ simulations; inputs incl. team quality, cards, game state, xG, stoppage time). Updated ~1/min in-play.
TM15 Team & Player Forecast	per docs	Pre-match player probabilities — goalscorer priors for scorer markets
TM11/TM12 Tournament / Season Simulations	per docs	Season-level probabilities — futures/outright markets (later phase)
MA12 Match Expected Goals	per docs	Live xG — input to totals/next-goal pricing and overlay display
MA19 / MA47 Penalties / Corners Preview	per docs	Market-specific priors (penalty propensity, corner rates)
MA15 Match Facts Betting	/soccerdata/matchfactsbetting/{outletAuthKey}/{fixtureUuid}	Automated betting-relevant facts — surfaced as bet-suggestion cards in the overlay
Dynamic Betting Stats API	per docs	On-demand situational betting stats for player props and market context

How probability-driven betting works in goal.live

```

MA21 / forecast feeds → probability normaliser → goal.live pricing engine
                        | decimal odds = 1 / p, plus transparent margin
                        ▼
                overlay markets (odds shown with "powered by Opta model" fair-value)
                        | user taps player / market → stake
                        ▼
        bet locked (Supabase + on-chain audit) → MA3DP event settles market
                        ▼
        smart-contract payout in USDC (oracle writes result from MA1/MA3)

```

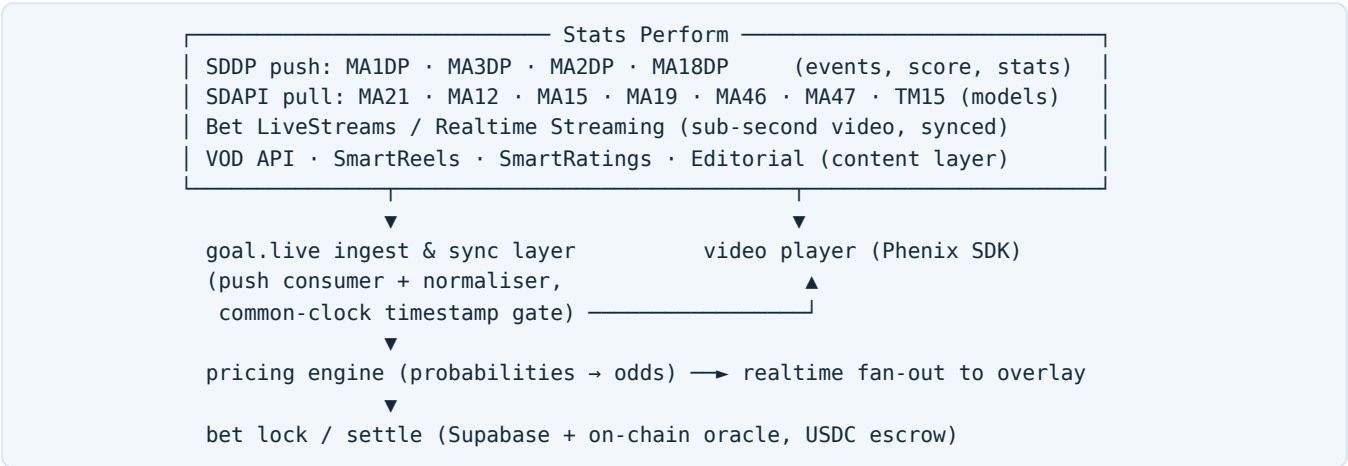

- Pricing:** model probability p → fair decimal odds $1/p$ → small transparent overround applied → published to all clients simultaneously via our realtime layer. Because our escrow is per-match pool based, probabilities can also drive a *parimutuel* view (pool share vs model fair value), which suits prediction-market regulation contexts.
- Repricing:** every MA21 update (and every MA3DP event) triggers reprice; markets auto-suspend on goal/penalty/red-card deltas before reopening at new prices.
- Settlement:** unchanged — MA3DP events (goal + scorer ID, corner, card) drive our existing oracle → smart contract settlement, so pricing and resolution share one Opta source of truth.

4. **Transparency:** we display the model probability alongside odds — a differentiator only possible with model-based feeds rather than bookmaker prices.

5. LIVE VIDEO — BET LIVESTREAMS (LA LIGA 2026/27) + VOD

- **Live, ultra-low latency (the core ask): Bet LiveStreams** delivered over **Realtime Streaming** (Phenix technology) — sub-second glass-to-glass latency with cross-device sync, for La Liga 2026/27 in our licensed markets. Our overlay wraps the stream player; market open/suspend states are gated to the synced video timeline. We request the playback SDK and the stream/data timestamp documentation.
- **VOD API** (docs/rh/video(vod) — API reference & query parameters + shared authorisation guide): on-demand assets — goals, highlights, near-live clips — used for (a) instant replay cards in the overlay after a settled bet ("watch the goal you won on") and (b) match recap pages on our site. We will authenticate per the shared API Overview & Authorisation guide.
- **SmartReels** (Broadcasts API): automated, personalised highlight reels and *catch-up-to-live* — lets a user joining mid-match catch up in 60 seconds, then land in the live synced stream with markets open. Strong retention feature for our beta cohort.

6. EVERYTHING SYNCED — TARGET ARCHITECTURE

The common-clock gate — aligning MA3DP event timestamps and odds updates with the video timeline — is the piece we most want to validate with your solutions engineers; it is the core of our patent-pending UX and the reason we are consolidating video + events + probabilities with Stats Perform.

7. ADDITIONAL SERVICES WE INTEND TO USE

Product	API	Use in goal.live
SmartRatings	Alerts API	Real-time excitement ratings & alerts — notify users when a La Liga match "catches fire" (push notification → deep-link into stream + markets). Drives session starts.
SmartReels	Broadcasts API	Auto-generated highlights & catch-up-to-live inside the overlay and on our site.
Editorial	Editorial APIs (docs/rh/editorial)	Match previews/recaps and football news on our website — content service around the betting product.
MA6 Commentary	SDAPI	Live text commentary ticker in the overlay.
MA27 Match Momentum	SDAPI	Momentum/pressure widget; also a trigger for contextual market prompts ("momentum surge — next goal?").
MA20 / TM10 Player Ratings	SDAPI	Live player ratings shown on tap of a player (clickable-player UX).
MA25 Match Tracking / Opta Vision	SDAPI / per docs	Post-match XY tracking (MA25) for replay & calibration of our clickable-player overlay; we would welcome a conversation about live tracking (Opta Vision / enriched events MA35-36) availability for La Liga to anchor player hotspots to real positions.
MA53 Match Stream	/soccerdata/matchstream/{outletAuthKey}/{fixtureUuid}	Combined previews / commentary / betting-insight stream — single-call content for match pages.

8. COVERAGE, AUTH & OPERATIONAL NOTES

- **Competition scope:** Spanish La Liga, 2026/27 season (Tournament Calendar via OT2; fixtures via MA0/MA1). La Liga's top coverage tier gives full MA3 event detail incl. player qualifiers required for our settlement logic (per Soccer Coverage Tiers documentation).
- **Auth:** existing OAuth 2.0 client-credentials flow against the SDAPI gateway; VOD/streaming auth per the shared API Overview & Authorisation guide; outlet keys per environment (staging/production).
- **Rate discipline:** with SDDP push replacing live polling, our remaining REST polling is limited to model feeds (MA21 1/min in-play per guidelines, delta parameter `_dl_t` used throughout) — well inside documented polling frequencies.
- **Compliance:** betting operation runs under our licensing roadmap (EU, starting CZ); settlement-grade data usage confined to licensed markets; we follow feed-security best practice per the FAQs.

9. WHAT WE ASK FROM STATS PERFORM

1. Developer licence enabling, for La Liga 2026/27: **SDAPI soccer feeds** (MA0/MA1, MA3, MA6, MA12, MA15, MA19, MA20, MA21, MA27, MA46, MA47, MA53, TM15, OT2, PE3/PE13), **SDDP push** (MA1DP, MA2DP, MA3DP, MA18DP), **Dynamic Betting Stats API**, **VOD API**, **SmartRatings Alerts API**, **SmartReels Broadcasts API**, **Editorial API**.
2. **Bet LiveStreams / Realtime Streaming** commercial terms for La Liga 2026/27 in our launch markets, incl. playback SDK and stream/data synchronisation documentation.

3. SDDP onboarding pack + staging environment for push-consumer validation ahead of the season.
4. A technical session with your solutions engineers on the video ↔ data common-clock synchronisation.

goal.live — a DotLive Interactive product. Patent-pending interactive betting overlays for live streams. Feed codes and endpoints referenced from Stats Perform SDAP/SDDP documentation (documentation.statsperform.com).
