

goal.live × Stats Perform — Integration Brief

Prepared for: Stats Perform / Opta Business Development · Contact: Peter Krulis, Founder — petrkrulis@gmail.com · June 12, 2026

1. WHAT GOAL.LIVE IS

goal.live is a **patent-pending interactive betting overlay for live sports streams**. Instead of forcing fans to leave the stream and bet on stale odds in a separate app, our overlay renders betting markets directly on top of the video player — users bet on in-game micro-moments (next goal scorer, next corner, next card) in real time, with instant on-chain USDC settlement. Any sport, any device, any event.

- 6 active beta testers today, averaging **15+ micro-bets per match** when friction is removed.
- **FIFA World Cup (June 11 – July 18, 2026): 100-tester beta across all 64 matches** — our major validation event, running now.
- \$1M seed round in progress; our 12-month roadmap explicitly includes Stats Perform odds/event integration and Phenix-based latency reduction as the next two milestones.

2. WHAT WE HAVE ALREADY BUILT ON OPTA

We are not starting from zero — we have a **working integration against the Opta SDAPI** (trial key), live in our platform today:

Component	Opta product used	Status
OAuth 2.0 client-credentials flow against <code>api.statsperform.com</code>	API Gateway	✓ Live
Match status, score, minute sync (polled every minute via cron)	MA1 – Fixtures & Results (live=yes)	✓ Live
Goal & corner event detection (typeId 16 / 22, own-goal qualifier 55)	MA3 – Match Events	✓ Live
Auto-seeding starting XIs into our player markets	MA46 – Provisional Line-Ups	✓ Live
Bet locking, settlement triggers, odds history	Internal, driven by MA1/MA3 data	✓ Live

The full Opta soccer feed catalogue (MA0–MA62, TM, PE feeds) is already mapped in our data layer, and our oracle/settlement pipeline (Chainlink CRE, Hedera, Solana variants) consumes the same normalized event schema.

3. WHAT WE NEED FROM STATS PERFORM

Our product lives or dies on one thing: **video, events, and odds arriving on the user's screen at the same moment, with sub-second latency**. We believe Stats Perform is the only provider that can deliver all three from a single source, especially since the Phenix acquisition. Concretely:

a) Ultra-low-latency live video — Realtime Streaming / Bet LiveStreams (Phenix)

- Sub-second (~0.5s) glass-to-glass streams of football matches that our overlay renders on top of.
- **Cross-device audience sync (≤100 ms)** so every user sees the same frame when a market opens or suspends — critical for fairness and courtsiding protection in micro-betting.
- Playback SDK / embeddable player we can wrap with our overlay (web first; browser-extension and mobile next).

b) Real-time match events — MA3 push / RunningBall Ultrafast Data

- Upgrade from our current 60-second MA1/MA3 polling to **push delivery** (webhooks or streaming API) for goals, corners, cards, penalties, VAR, dangerous attacks.
- Event timestamps we can use to align data with the video timeline (see d).

c) Live odds & micro-markets — Bet Trading Data / Opta for Prediction Markets

- Real-time in-play odds for match and micro-moment markets (next goal, next scorer, next corner, race-to-X), pushed as they change so our on-screen odds are never stale.
- Player-level pricing to power our clickable-player overlay (bet by tapping a player on the pitch).
- Settlement-grade results data — our smart contracts settle bets autonomously from these feeds, so we need the same source of truth for pricing and resolution.

d) Synchronization layer — the key ask

A common clock between stream and data: per-frame or per-segment timestamps on the video plus matching timestamps on events/odds, so our platform can **gate market open/suspend/settle to what the user has actually seen**, consistently across all devices. This sync is the core of our patent-pending UX, and the reason we want video + data from one provider rather than stitching vendors together.

4. PROPOSED INTEGRATION ARCHITECTURE

```

Opta MA feeds / RunningBall push → goal.live sync layer (already built)
Bet Trading Data (odds push)      → odds engine → markets + on-chain settlement
Realtime Streaming (Phenix)       → video player ← overlay (timestamp-synced)
  
```

We would start with **one league / competition scope on trial-to-production keys**, validate the synced pipeline during the remainder of the World Cup beta, then expand coverage with our post-seed league partnerships.

5. ASKS FOR THE BD TEAM

1. Production access & pricing for: **MA1/MA3 (push), MA46, Bet Trading Data (or Opta for Prediction Markets), Realtime Streaming / Bet LiveStreams** for one pilot competition.
2. Technical documentation for push delivery and the stream/data synchronization mechanism (timestamps, SDKs).
3. Betting-rights guidance: which competitions Stats Perform can license to us for streaming with betting overlays in our launch markets (EU, starting CZ).
4. A technical call between our engineering team and your solutions engineers to validate the sync architecture.
